

A Statistical Study of the Text of NA27 Matthew

by James D. Price, August, 2008

This is a study of the textual statistics of the book of Matthew in the 27th edition of the Nestle-Aland Greek New Testament (NA27).¹ It is based on the electronic textual apparatus supplied in the *Stuttgart Electronic Study Bible*.² The NA27 textual apparatus for Matthew contains 1,428 places of variation, excluding those the editors marked with square brackets [] as conjectures; it also contains 270 manuscript (ms) witnesses, including the correctors, ancient versions, and the early Church Fathers. This study includes the evidence from all 270 witnesses as it relates to the existence of text types and the Byzantine tradition as a text prior to the fourth century AD.

The text of NA27 is based primarily on the witness of the two most ancient (4th century AD) complete manuscripts (mss), Sinaiticus, represented by the symbol Ι (Aleph),³ and Vaticanus, represented by the symbol B; although a number of other witnesses support the readings of these manuscripts. The first hands of the two mss agree in 954 of the 1,428 places of variation, or 66.8% of the time—a diversity not characteristic of a stable text.

The NA27 text is supported by Ι (or one of its correctors) 1,331 times (Ι* 1,061x, Ι¹ 93x, Ι² 91x, and Ι^c 68x), and by B (or one of its correctors) 1,234 times (B* 1,182x, B¹ 25x, and B² 27x). The text is supported by both Ι (or one of its correctors) and B (or one of its correctors) 1,012 times. The text is supported by Ι against B 172 times and by B against Ι 201 times. This leaves 43 places of variation where the text is not supported by either Ι or B or their correctors. Of these 43 places, 38 are supported by the Majority Text (MT) and 37 by the *Textus Receptus* (TR) of F. H. A. Scrivener (1894 & 1902).⁴ Ms Ι (or one of its correctors) has the same reading as the MT (or one of its sub-groups) 828 times (or 58.0%), and Ms B (or one of its correctors) has

⁴ *H KAINH ΔIAOHKH—The New Testament: The Greek Text Underlying the English Authorized Version of 1611* (London: The Trinitarian Bible Society, n.d.). The NA27 textual apparatus does not record the readings of the TR. I have added them to my edited version of that data base.

the same reading as the MT (or one of its sub-groups) 724 times (or 50.7%). The MT (or one of its sub-groups) supports the NA27 text 859 times (or 60.1%) and the TR supports the NA27 text 828 times (or 58.0%). These facts indicate that, while the NA27 editors highly regarded the witness of these two mss, other textual factors also were involved in their decisions.

Text Types

Textual scholars generally acknowledge the existence of four text traditions among the surviving manuscripts of the Greek New Testament: the Alexandrian, Western, Caesarean, and Byzantine (Majority Text). The evidence for this conclusion is that each tradition has a collection of readings that are unique to itself, not being shared with the other traditions. The unique readings identify a text tradition as genealogically independent of the others. The non-unique readings exhibit genealogical affinity with the readings of one or more of the other traditions. Genealogical relations among the variant readings of the manuscripts make it possible to trace genealogical descent among the mss, much like DNA does in biology. Genealogical ancestry is determined by consensus among independent witnesses; the probability of the autographic readings may be determined by consensus among the ancient independent witnesses. This section of the study examines the evidence for text types in the book of Matthew.

For establishing a starting point for this study, Χ and B (together with their correctors) are assumed to be the representative mss for the Alexandrian tradition; the fourth century Old Latin ms it^a is assumed to be the representative for the Western tradition, ms Θ the representative for the Caesarean tradition, and the three sub-groups of the MT for the Byzantine tradition.⁵ Under these assumptions, the following data are pertinent:

(1) Alexandrian differs from the MT	499 times	
(2) Alexandrian differs from Western	382 times	
(3) Alexandrian differs from Caesarean	379 times	
(4) Alexandrian differs for all three	586 times	(the uniquely Alexandrian readings)
(5) Western differs from MT	490 times	
(6) Western differs from Alexandrian	382 times	
(7) Western differs from Caesarean	532 times	

⁵ This preliminary assumption is based on Bruce M. Metzger's description of the text types in his *The Text of the New Testament*, 3rd, enlarged edition (New York: Oxford Press, 1992), pp. 213-16. My selection of the prominent mss of each tradition provides an initial approximation of the form of the text traditions. Subsequent genealogical studies, using my genealogical software, will define the boundaries of the traditions more accurately.

(8) Western differs from all three	185 times	(the uniquely Western readings)
(9) Caesarean differs from MT	506 times	
(10) Caesarean differs from Alexandrian	379 times	
(11) Caesarean differs from Western	532 times	
(12) Caesarean differs from all three	117 times	(the uniquely Caesarean readings)
(13) MT differs from Alexandrian	499 times	
(14) MT differs from Western	490 times	
(15) MT differs from Caesarean	506 times	
(16) MT differs from all three	228 times	(the uniquely Byzantine readings)

See Appendix A for a list of how the 270 witnesses agree with these four text types. The 11th column lists the number of uniquely MT readings a ms supports.

The Alexandrian Text Type

The Alexandrian text type of Matthew, as represented herein by Ι and/or B (and their correctors), has 586 unique readings that set it off from the other text traditions. The remaining readings are shared with the other text types and are evidence of genealogical mixture with one or more of the other traditions. Besides Ι and B, this text tradition is also supported by 19 Papyrus manuscripts, dating from the second to the seventh century, all of which are fragmentary; they support the readings of Ι and B (or their correctors) in the range of 63-100% of the time. These papyri support 316 readings, only four of which are among the uniquely Byzantine ones.⁶ Table 1 lists the data, and Appendix B shows the papyri support for each of the four text types.

This text tradition is also supported by 24 uncial mss, a number of which are fragmentary. They support the readings of Ι and B (or their correctors) in the range of 61-100% of the time. However, those mss having most of the text support the text only in the range of 60-70%. They support 25,494 readings, 273 of which are among the uniquely Byzantine ones; however, only the 2 from the 4th century and earlier are significant with respect to validating early uniquely Byzantine readings.⁷ Table 2 lists the data, and Appendix C shows the support these mss have for the four text types.

⁶ P⁴⁵ (III) at Matt. 20:30 (2x); 26:7; 26:27.

14	P ⁸⁶	350	6	6	100	0
15	P ¹⁹	400	16	17	94.1	0
16	P ¹⁰⁵	500	2	2	100	0
17	P ⁸³	550	6	6	100	0
18	P ⁹⁶	550	3	3	100	0
19	P ⁴⁴	600	11	11	100	0

This text is also supported by the eight Egyptian translations (c. AD 250) in the range of 83-100%, by seven Latin translations (AD 400+) in the range of 80%, by one Syriac translation (sy^s) at 72.3%, and by the Gothic (c. 350), Armenian (c. 450), Georgian (c. 625), and Slavic (c. 850) translations all at 99%. These versions witness to 21,502 readings of which 141 are uniquely Byzantine readings. However, only the 89 from the 4th century and earlier are significant with respect to validating early uniquely Byzantine readings. Table 3 lists the data, and Appendix D shows the support of these versions for each of the four text types.

The NA27 apparatus lists 43 Church Fathers dating from AD 100 to 466. Their witness is very sparse, several providing only one reading, and the others providing at the most only 94. Combined they provide readings at 811 places of variations, 24 of which support uniquely Byzantine readings.⁸ None of the fathers strongly support any text type except those having a very small number of readings where the statistics has no significance. Nine support the Alexandrian Text in the range of 75-100% (see Table 4), but their witness is so fragmentary as to render their support

⁸ 1:18 (2x); 1:22; 3:25; 7:24; 8:25; 14:25; 16:8; 16:28; 17:3 19:17; 20:22; 25:32; 26:22.

insignificant. They support 245 readings and 3 uniquely Byzantine readings. Appendix E shows the support of all the Church Fathers for the four text types.

D05 ^c	1150	809	1282	63.1%	41
Total			25,494		273

In summary, the Alexandrian text tradition, as initially assumed to be the text supported by **N** and/or **B** (and their correctors), is also supported by 19 papyrus fragments, 24 uncial manuscripts in the range of 60%, 22 ancient versions (10 prior to AD 400) in the range of 80-99%, and 9 Church Fathers. It has 586 unique readings that set it off as an independent tradition. While the witnesses to the text prior to AD 400 support about 75% of its unique readings, the Greek witnesses are quite diverse (in the range of 67%). However the early Egyptian translations support the text in the range of 85-99%, establishing the stability of the text prior to AD 250.

The Western Text Type

The Western text type of Matthew, as represented herein by the fourth century Old Latin version it^a, has 185 unique readings that set it off from the other traditions. This text tradition is also supported by 20 other Old Latin versions in the range of 85-98% with few exceptions.⁹ In addition, this tradition is supported by P¹⁰¹ at 81.8%, by 3 Church Fathers in the range of 66-100%,

⁹ it^k (83.0%); it^{mu} (78.2%).

and by the uncial fragment 0271 at 100%. Table 5 lists the data, and Appendix F shows how these witnesses support the four text types.

it-g1 ^c	800	1066	1169	91.2%	3
0271	850	11	11	100.0%	0
it-c	1200	1061	1172	90.5%	12
			17,843		271

These 25 witnesses provide 17,843 readings of which 271 are uniquely Byzantine readings. However, only the 9 from the 4th century and earlier are significant with respect to validating early uniquely Byzantine readings. Appendix B shows the relatively weak support of the papyri for the Western Text. Appendices A and C show the relatively weak support of manuscripts for this text. Appendices A and D show the relatively weak support of the non-Latin versions for this text. And Appendix E shows the relatively weak support of the Church Fathers.

In summary, the Western Text of Matthew, as initially represented herein by the 4th century Old Latin ms it^a, is also supported by 20 other Old Latin versions in the range of 75-98%, by three 3rd and 4th century Church Fathers, by one papyrus ms, and by one 9th century uncial fragment. It has 185 unique readings that set it off as an independent tradition. This tradition is established almost exclusively by the Old Latin versions. The text lacks stability, exhibiting diversity mainly in the range of about 80-93%.

The Caesarean Text Type

The Caesarean text type of Matthew, as represented herein by ms Θ, has 117 unique readings that set it off from the other traditions. Of the 1,346 readings preserved in Θ, 970 (72.0%) support the Alexandrian Text, 833 (61.9%) support the Western Text, and 834 (62.0%) support the Byzantine Text, so the ms has considerable mixture. The text is also supported by one Church Father and two uncial fragments (see Table 6). The text is also mildly supported by the Latin Vulgate witnesses and the Armenian version, but these witnesses more strongly support the Alexandrian text. Appendix G shows how well these witnesses agree with the other text types.

Table 6

Witnesses Supporting the Caesarean Text

Ms	Date	Caes	Total	%	Unique Byz
Cl ^{hom}	250	1	1	100.0%	0
0171	300	12	16	75.0%	0
arm	450	522	734	71.1%	0
vg*	500	712	1150	61.9%	5
vg ^b	500	679	1154	58.8%	9
0271	850	11	11	100.0%	0
vg ^s	1590	710	1152	61.6%	5
vg ^{cl}	1592	710	1166	60.9%	8
vg ^{ww}	1889	712	1160	61.4%	5
vg st	1994	714	1166	61.2%	5
Totals			6660		37

These witnesses support 6,660 Caesarean readings, including 37 uniquely Byzantine readings. However, none of the unique readings occur before the 4th century. Appendix B shows the relatively weak support of the Papyri for this text. Appendices A and C show the relatively weak support of manuscripts for this text. Appendices A and D show the relatively weak support of the non-Latin versions for this text. And Appendix E shows the relatively weak support of the Church Fathers.

In summary, although this tradition is weakly attested, it has 117 unique readings that distinguish it from the others. It may be considered an independent witness of only secondary importance for Matthew.

The Byzantine Text Type

The Majority (or Byzantine) text type of Matthew, as represented in NA27 by the symbol ⩿, together with its two subgroups¹⁰ has 228 unique readings that set it off from the other traditions. This text tradition is supported by 115 witnesses of various types in the range of 81-99%. Table 7 lists the 115 witnesses supporting the Byzantine Text. Apart from the Harclean Syriac, sy^h (AD 616), all the other witnesses are Greek mss. No other versions or Church Fathers support the Byzantine Text more than they do at least one of the other text types. It is significant that the earliest mss support the text the least and have the least number of uniquely Byzantine readings. Appendix H shows how these manuscripts support each of the four text types. Although a number of early mss have genealogical affinity with the Byzantine Text, none is in the range of 90% or better (suggesting a stable text) until the sixth century ms O.¹¹

Table 7

Ms	Date	Byz	Total	%	Uniquely Byz

¹⁰ In this study, in order to avoid mixed fonts in the data base, the Majority Text is represented by the symbol pm^a and its two sub-groups by the symbols pm^b and pm^c respectively. Sub-group pm^b differs from pm^a in 51 places of variation, and pm^c in one place. In addition, manuscripts whose symbol is a non-English character are represented by their corresponding number. Thus ⩿ = 01, Γ = G011, Δ = D05, E = E07, H = H013, Θ = 038, Λ = L019, etc.

¹¹ Although uncial 0160 has 91.7% agreement with the MT, it is fragmentary, having readings in only 12 out of the 1428 places of variations. Such a small sample renders the evidence statistically insignificant.

Ambiguous Witnesses

Of the 270 witnesses to Matthew in NA27, 41 lack a clear genealogical affinity with any of the four text traditions, being evidently of genealogically mixed origin. Their genealogical descent cannot be inferred on the basis of percentage of agreement, but must be determined later by my genealogical software. Table 8 lists the ambiguous witnesses in order by date.

Table 8

Byzantine as a Text before the Fourth Century

For those who claim that the Byzantine (MT) Text, or its derivative the *Textus Receptus* (TR), is the autographic text or at least its best representative, an important consideration is the evidence supporting that claim. If that claim is valid, one would expect the text to have early witnesses, that is, complete (or nearly complete) manuscripts containing all (or nearly all) Byzantine readings. The problem is that the earliest witnesses to the text have the least percentage of Byzantine readings (see Table 7 and the discussion on p. 9), contrary to this expectation. The typical explanation for this dilemma is that all the good early copies of the MT perished from use, an argument from silence; surely providence would have preserved a few. In order to support this claim, it is said that all (or most of) the Byzantine readings are found in the early witnesses to the other text types. This section of the study examines the evidence for that claim.

In all the Tables in the previous sections of this study a column was provided listing the number of uniquely Byzantine readings supported by the relevant witnesses. By looking at the mere numbers in that column one might get the impression that this claim is true. However, an exhaustive study of when these unique readings were first contained in any manuscript indicates otherwise. Table 9 lists the 228 places of variation where the Byzantine Text has a unique reading. The second column lists the reference where the variation occurs, and the third column lists the variation unit number and variant number for each unique reading; the number before the period is the variation unit number, and the number after the period is the variant number. For example, “19.2” refers to the 19th place of variation, and the 2nd variant at that place. In the NA27 text, this variant ($\gamma\epsilon\nu\sigma\iota$) occurs in Matthew 1:18. The following explains how to interpret the evidence in

Table 9. For example, row 10 indicated that variant 56.2 first appeared sometime between AD 500 and 600 during which time the variant occurred in three witnesses of that date.¹²

Counting the entries in the date columns, the table indicates that 60 of the 228 unique readings (26.3%) occurred in some witnesses prior to AD 400; by AD 400, 190 of the 228 variants (83.3%) had occurred in some witnesses; by AD 500, 213 of the 228 variants (93.4%) had occurred in some witnesses; and by AD 600, all the unique readings but one were accounted for; this exception is recorded in row 201, variant 1288.5; this is the 5th variant in Matthew 26:59 which reads θαντωσωσιν αυτον. This variant is supported by only four late mss¹³ and part of the MT; it occurs first in the 9th century. This may appear insignificant because it involves only part of the MT. However, the other part of the MT supports variant 1288.3, another uniquely MT reading, θαντωσουσιν αυτον, a spelling variation; and this reading is supported by only four mss¹⁴ dating from AD 400 and later. Interestingly, the NA27 editors selected seven of the uniquely Byzantine readings as original against both K and B (65.1, 66.1, 314.1, 899.1, 946.1, 949.1, and 1171.1), two being supported by mss dating from before AD 400 (946.1 and 949.1).

Table 9
Date when Variant First Introduced

	Variant	Reference	< 400	<= 400	<= 500	< 600	<= 600
1	19.2	1:18	19.2 3	19.2 3	19.2 3	19.2 6	19.2 6
2	24.2	1:22	24.2 2	24.2 2	24.2 2	24.2 5	24.2 5

One may still argue that the reason for this lack of early support of the Byzantine text is the paucity of witnesses prior to AD 400. Appendix A lists 67 witnesses that date prior to AD 400, although all of them are fragmentary to some degree except *N* and *B*. Nevertheless, 12 of the 67 have readings at 50% or more of the 1428 places of variation. These are all ancient versions, including the oldest Old Latin and oldest Syriac witnesses, that bear witness to 11,738 readings. Table 10 lists the data.

Table 10
Percentage of Text in Pre-400 Witnesses

Total		11,738	

Now one may still suppose that not all the places of variation have witnesses dating before AD 400, and that this accounts for the paucity of uniquely Byzantine readings before AD 400. However, an exhaustive electronic search indicated that all 1428 places of variation have at least one pre-400 witness. So it is significant that only 60 of the 228 uniquely Byzantine readings (26.3%) are witnessed before AD 400. On the other hand, it is significant that nearly all the pre-400 witnesses demonstrate greater genealogical affinity to the Alexandrian text-type than to the Byzantine text-type. The next section investigates the pre-400 witnesses to the uniquely Alexandrian readings.

Alexandrian as a Text before AD 400

Contrary to the Byzantine Text, the Alexandrian Text has significantly better pre-400 support for its unique readings; 442 of its 586 unique readings (75.4%) are supported by at least one witness dating before AD 400. The witnesses dating before AD 350 support 215 of the 585 uniquely Alexandrian readings (36.7%); and those before AD 300 support 196 of the 586 unique readings (33.4%). This indicates that the Alexandrian Text has earlier genealogical roots than does the Byzantine Text. These data indicate that the Alexandrian Text is not identical with the autographic text, but this observation is not significant because no one claims that identity. While the NA27 editors usually granted priority to the Alexandrian Text, they sometimes decided on the priority of non-Alexandrian readings, some of which are supported by the Byzantine text.

Conclusion

This study has demonstrated that there is sufficient evidence to accept the existence of four independent text types: Alexandrian, Western, Caesarean, and Byzantine, although the evidence for an independent Caesarean Text is weak—it appears to have considerable mixture. While the witnesses to the Alexandrian Text are more diverse than those of the Byzantine Text, yet the Alexandrian Text has deeper and earlier genealogical roots than does the Byzantine Text. The Byzantine Text has no witnesses with strong genealogical affinity ($> 90\%$) prior to the sixth century, and those early representatives that do exist are the most diverse. In addition, only 26% of the uniquely Byzantine readings are found in witnesses prior to AD 400, even though each of the 1428 places of variation has at least one witness prior to that date. All this evidence suggests the later development of the Byzantine Text. By contrast, 75% of the uniquely Alexandrian readings have supporting witnesses prior to AD 400, suggesting a significantly earlier development of that text type, even though its representatives are more diverse.

Appendix A

This appendix shows the number of times the text of the listed manuscripts agree with the text of the assumed four text types. The manuscripts are listed in order by date.¹⁵

¹⁵ The NA27 apparatus usually lists dates in Roman numerals by century except where a more exact date is known; in that case, the dates are listed in Arabic numerals. In this work, I list all dates in Arabic numerals for the sake of consistency and the requirements on my software. When converting the Roman numerals to Arabic ones, the following conversion is followed: II-III = 200; III = 250; III-IV = 300; IV = 350, etc.
